

Document Verification Flow

A simple view of what happens after a user submits a document.

Status and exception guide

Status	Meaning for the user
UPLOADED	The API received the upload request.
QUARANTINED	The file passed intake checks and is stored away from normal processing.
SCANNING	The malware scanner is checking the quarantined file.
PROCESSING	Document information is being extracted and verified.
COMPLETED	Automated processing finished successfully.
MANUAL_REVIEW	A reviewer needs to inspect the document or provide a decision.
FAILED	Processing stopped safely. Retry may be available if the file is not infected and has not expired.

Common exception paths

Situation	Result
Wrong extension or signature	Upload rejected before storage.
File larger than 25 MB	Upload rejected with a size-limit response.
More than 100 pages	Upload rejected before background processing.
Exact duplicate	Upload rejected and existing document ID returned.
Malware detected	Document marked FAILED; retry is blocked.
Password-protected PDF	Rejected or sent to MANUAL_REVIEW according to policy.
Redis or storage unavailable	API fails safely with service unavailable instead of losing work.
Retention period reached	File bytes are deleted; audit metadata remains and storage shows Expired.

Where each item lives

- MySQL: case and document records
- MinIO/local quarantine: uploaded file bytes
- Redis: rate counters and task messages
- Celery: background processing
- ClamAV: malware scan
